

## Woodworking for beginners; a manual for amateurs

This historic book may have numerous typos and missing text. Purchasers can download a free scanned copy of the original book (without typos) from the publisher. Not indexed. Not illustrated. 1907 Excerpt: ...instead of the inside. Nail a seat at each end directly on top of the sides and ends as shown. From 12 to 18 in width will do. The seat for rowing (about 8 or 9 wide) can rest on cleats, as shown. Next screw a cleat, about 2 deep, thick, and 10 long, to the S insides of the gunwales at the places for the rowlocks (see Screws). Common iron rowlocks can be bought almost anywhere, and the way to put them on is obvious (see Boring). A substitute for them can be arranged easily by simply boring two holes, 3 apart, for the insertion of round thole pins of hard wood. Another simple way (Fig. 409) is to make two mortises or slots, 3I apart and H long x wide, to Fig. 4og. Fig. 410.,.,.,. hold thole pins (Fig. 410). The cutting can be done wholly in the cleats by sawing and paring. Insert a ring-bolt at the end by which to fasten the boat, or a staple can be driven in, or a hole bored at the end of the seat. If care has been taken to make close joints, the wood will swell on being put in the water and in a short time the boat should be tight. Unless made for some temporary purpose, however, a boat that is worth making at all is worth painting. It should be painted carefully with lead paint, both inside and out, two or three coats, being careful to work the paint well into the wood and the cracks (see Painting). Instead of laying the bottom boards tightly together, as directed above, they can be laid slightly apart, so that the cracks between them will be about wide. These can then be caulked with oakum, cotton-batting, or wicking, or something of that nature. Roll or twist the material into a loose cord, unless already in that form, and force it into the cracks with a putty-knife, screwdriver, case...
