

Geophysics for Petroleum Engineers: Chapter 7. Reservoir Monitoring (Developments in Petroleum Science)

Monitoring or surveillance of reservoir fluids during the producing life of a field and mapping of oilwater and gasoil interface are necessary for understanding the fluid dynamics. This information would allow improving developmental plans, locate production and injection wells, and optimize reservoir management. Engineers would like to have information between the well control for field-wide surveillance of fluid front. This would permit forecasting arrival of water in a producing well or understanding the effectiveness of sweep from the injected water or gas. Geophysical monitoring could have major impact on ultimate recovery and drilling efficiency.
